                                                                                                                                                                                                                                                                                                                                                                                                                                                                Aljinovic G., Pohl F.M., Pohl T.M.;
Submitted (AUG-1994) to the EMEL/GENBANK/DDBJ databases.
Submitted (AUG-1994) to the EMEL/GENBANTON OF PHOSPHOENOLPYRUVATE
-I- FUNCTION: STRENGASPECIFIC CONDENSATION OF PHOSPHOENOLPYRUVATE
-AND D-ERYTHROSE-4-PHOSPHATE (PAP) GIVING RISE TO 3-DEOXY-D-
ARABINO-HEPTULOSONATE-7-PHOSPHATE (DAHP)
-I- CARALFUL ACTIVITY: 2-dehyylro-3-deoxy-D-arabino-heptonate 7-
phosphate + phosphate - phosphoenolpyruvate + D-erythrose 4-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Dolgnon F., Biteau N., Aigle M., Crouzet M.;
"The complete sequence of a 6794 bp segment located on the right arm of chromosome II of Saccharomyces cerevisiae. Finding of a putative dUTPase in a yeast.";
Yeast 9:1131-1137(1993).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    synthase from Saccharomyces
Gene 113:67-74(1992).

(R. N) repetide where n = 1-10; X = CG-, when the X group is attached to the N-terminus of the peptide, or a side chain of the peptide where the functional group of the side chain is NH2 or OH; or X = O or NH.

CC when the R.X group is attached to the C-terminus of the peptide, or a side chain of the peptide, where the side chain functional group is 5 COOH or CONIE; and R = 2-18C alkyl or atkoxy, 2-14C alkylenyl containing one two double bonds, cyclobutyl, cyclopentyl, cyclohexyl optionally compositionally monosubstituted with a 1-5C straight or branched chain alkyl group, or benzyl. The peptides ABB7001-B3705B represent analogues of the peptide portion of the conjugate or tranship to amino acids 72-97 of the BB3 domain of the cell death agonist Bad. The peptide conjugate is cusful for modulating apportusis the cells of a subject or or reversing B cell lymphoma/lenkemia 2 (BCI-2) mediated blockage of apoptosis in cancer cells. It is also useful for inhibiting BCI-2 subject affilicted with a cancer characterized by cancer cells that express BcI-2. The cancer includes prostate, colorectal, gastric, conjugate is also useful for creating a subject affilicted with a cancer characterized by cancer cells that express BcI-2. The cancer includes prostate, colorectal, gastric, only step is also useful for treating a subject affined by renal or thyroid cancers, neuroblastoma, melanoma, or conjugate is also useful for peptide conjugate is also useful for percent and peptide conjugate is necessarily and percent and peptide conjugate is necessarily and percent and peptide conjugate is necessarily and percent and peptide conjugate is a necessarily and percent and peptide conjugate is necessarily and percent and peptide conjugate is a necessarily and percent and percent and percent and percent and percent and pe

Human and murine p15 BID polypeptides with cell death agonist activity are produced by caspase cleavage of BID in cells undergoing FAS or tumour necrosis mediated cell death, useful as modulators of target cell death.

The present sequence represents a human p15 BID polypeptide. p15 BID polypeptides have cell death agonist activity. Cell death mediated by tumour necrosis factor (TNF) and FAS signalling pathways includes the generation of p15 BID, which is translocated to the micochondria where it exerts cell death agonist activity, probably by inducing release of cytochrome C. The p15 BID polypeptides are useful in methods for modulating death of a target cell. Mutants of p15 BID, comprising an inactivating mutation in the BIJ domain, are used in methods for inhibiting death of a target cell. Agents that specifically inhibit caspase cleavage of p22 BID at the p15 Cleavage site are also useful for inhibiting death of a target cell.

tumour necrosis factor; FAS signalling;

Human and murine pl5 BID polypeptides with cell death agonist activity are produced by caspase cleavage of BID in cells undergoing FAS or tumour necrosis mediated cell death, useful as modulators of target cell

The present sequence represents a variant of pl5 sID polypeptide. pl5 polypeptides have cell death aponist activity. Cell death mediated by polypeptides have cell death aponist activity. Cell death sediated by tumour necrosis factor (YNF) and FAS signalling pathways includes the generation of pl5 BID, which is translocated to the mitochondria where it exerts cell death agonist activity, probably by inducing release of

The p15 BLD polypeptides are useful in methods for modulating death of a target cell. Mutants of p15 BLD, comprising an inactivating mutation in the BH3 domain, are used in methods for inhibiting death of a target cell. Agents that specifically inhibit caspase cleavage of p22 BLD at the p15 cleavage site are also useful for inhibiting death of a target cell.
The invention relates to a method for negative selection assay that comprises introducing a genetic library encoding putative cytotoxic ... agent into a population of target celis, plating the celis on a surface, collecting a subpopulation of the celis that disattach from
                                                                                                                                                            Negative selection of cells for the identification cytotoxic agents -

The method is useful to identify cytostatic or cytotoxic agents that cause a lethal phenorype. The method is also useful to identify conditional cytotoxicity and cell specific cytotoxicity. The cytostatic or cytotoxic agents are useful in the treatment of cancer and other diseases involving abnormal cell proliferation. The present sequence is human pro-BID (BH) Interacting Domain Death Agonist) protein. Peptide fragments of BID referred as clones #1 and #2 are identified as cytotoxic agents by negative selection of HT29 colon cancer cells.
The present sequence represents a BH3 interacting domain death agonist (BID) protein given in the present invention. The protein, the DNA encoding it or antisense sequences can be used for preventing or treating a decreased apoptotic state of a cell. The decreased apoptotic state that is treated results from a disease such as cancer, viral infections, lymphoproliferative conditions, arthrills, inflammation and autoimmune diseases. Antibodies against the BTD protein can be used for detecting a BID polypeptide in a cell or population of cell. The nucleic acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human, BH3 interacting domain death agonist; BID; BCL-2 family; apoptosis; regulation; cell death; inflammation; cancer; arthritis; autolimmune disease; viral infection; lymphoproliferative.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Matches
                                                                                                                                                                            This sequence represents the HIV-1 Tat 1 protein.

The invention relates to a bol homology domain 3 (BH3 domain),
derived from a proapopotot member of the BCL-2 family. The
BH3 polypeptide can be used in a method for promoting apoptosis in a
BH3 polypeptide can be used in a method for promoting apoptosis in a
target cell, especially where the cell is a cancer cell a virus infected
cell or an autoantibody producing cell. The BH3 polypeptide can be used
in therapeutic compositions for treating disease including cencer, other
lymphoproliferative conditions, arthritis, inflammation, and autoimmune
diseases, which may result from the down regulation of cell death
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                sequence and the BID protein can also be used for treating immunodeficiency disease (including AIDS), senescence, neurodegenerations and infertility and insease, ischwemic and reperfusion cell death, infertility and wound healing. Primers derived from the nucleic acid encoding the BID protein can be used for detecting/squantitating the protein and for detecting alterations in the nucleic acid encoding the BID protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              BH3 domain: cell death agonist; bcl homology domain; BCL-2 family; appprosis promoter; cancer cell; virus infected cell; inflammation; autoantibody producing cell; cancer; lymphoproliferative condition; arthritis; autoimmune disease; therapy.

This sequence represents a secreted human protein encoded by the clone detailed in the descriptor line. The gene can be used to c fusion proteins by linking to the gene to a human immunoglobulin
                                                                                                                    New isolated human genes and the secreted polypeptides they encode useful for disgnosis and treatment of e.g. cancers, neurological disorders, immune diseases, inflammation or blood disorders
                                                                                                                                                                                                                                                                                 Greene
                                                                                                                                                                                                                                                                 Rosen

The invention relates to 87 novel genes and their fragments (nucleic acid sequences: AAX00611-X00724; amino acid sequences AAX07807-W68004) which are useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. Also, pathological conditions can be diagnosed by determining the amount of the new polypeptides in a sample or by determining the presence of mutations in the my polypeptides. Pased on which tissues are described for each of the 81 polypucleotides. Specific uses are described are most highly expressed (see AAX00611 for described uses).
                                                                                          Human and murine p15 BID polypeptides with cell death agonist activity are produced by caspase cleavage of BID in cells undergoing PAS or tumour necrosis mediated cell death, useful as modulators of target cell death.
The present sequence represents a human BID polypeptide. The specification describes p15 BID polypeptides which have cell death agonist activity. Cell death mediated by tumour necrosis factor (TNP) and FNS signalling pathways includes the generation of p15 BID, which is translocated to the mitochondria where it exertis cell death agonist activity, probably by inducing release of cytochrome C. The p15 BID
                                                                                                                                                                                                          19-AUG-1998;

```
polypeptides are useful in methods for modulating death of a target cell. Mutants of p15 BLD, comprising an inactivating mutation in the BH3 domain, are used in methods for inhibiting death of a target cell, Agents that specifically inhibit cospase cleavage of p22 BlD at the p15 cleavage site are also useful for inhibiting death of a target

BH3 interacting domain death agonist polypeptide - used for treating decreased apoptotic conditions resulting from inflammation etc.

Claim 4; Page 69; 118pp; English.

The present sequence represents a BH3 interacting domain death agonist BH10) protein given in the present invention. The protein, the DNA encoding it or antisense sequences can be used for preventing or treating a decreased apoptotic state of a cell. The decreased apoptotic state that is treated results from a disease such as cancer, viral interctions, lymphoproliferative conditions, arthritis, inflammation and autoimmune diseases. Antibodies against the BHD protein can be used for detecting a BHD polypeptide in a cell or population of cell. The nucleic acid sequence and the BHD protein can also be used for treating immunodeficiency disease (including AHDs), senescence, neurodegenerative disease, ischaemic and reperfusion cell death, inferturity and the BHD protein can also be used for treating the sequence and the BHD protein can also be used for treating the sequence is chassed (including AHDs), senescence, neurodegenerative disease, ischaemic and reperfusion cell death, inferturity and the BHD protein can be used for treating the sequence of the BHD protein can also be used for treating the BHD protein can also be used for treating the sequence of the BHD protein can also be used for treating the BHD protein can be used for the sequence of the BHD protein can also be used for treating the BHD protein can be used for the sequence of the BHD protein can be used for treating the BHD protein can be used for the sequence of the BHD protein can be used for the sequence of the BHD protein can be used for the sequence of the BHD protein can be used for the sequence of the BHD protein can be used for the sequence of the BHD protein can be used for the sequence of the BHD protein can be used for the sequence of the BHD protein can be used for the sequence of the BHD protein can be used for the sequence of the BHD protein can be used for the BHD protein can be used for the sequence of the BHD protein can be used for the BHD

Example 2; Fig 3a; 157pp; English.

The present invention describes an isolated or synthetic polypeptide (I) comprising a less than full lempth amino acid sequence of a mutant (I) comprising a less than full lempth amino acid sequence of a mutant (I) comprising a less than full lempth amino acid sequence of a mutant (I) comprise the contents amino acid substitutions at Serill of a human of the serils of a mutant amino acid substitutions at Serill of a human compression of the seril of a mutant amino acid substitutions at Serill of a mutant (I) has immunostimulant, neuroprotective, and contropic, antivired, antivired, and antiarthritic, antilifiammatory and immunosuppressive activities, and can be used as an apoptosis inducer or inhibitor. Bab polypeptides and drugs of your less that promote cell survival or apoptosis. Other uses include for activity that promote cell survival or apoptosis. Other uses include inducing or inhibiting apoptosis in a cell. Candidate compounds (identified and (mutant) Bab polypeptides are useful in treating climunodeficiency diseases, neurodegenerative diseases, viral infections. (I) imphoproliferative conditions, arthritis, infertility, infammation and caucinamuse diseases. The present sequence represents a Bcl-family member or news that consensus sequence which is used in an example from the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present sequence represents a BH3 interacting domain death agonist (BID) splitops given in the present invention. The used for protein, the DAM encoding it or antisense sequences can be used for preventing or treating a decreased apoptoric state of a cell. The decreased apoptoric state of a cell. The acceptance in the conditions, architis, another that is troated results from a disease such as cancer, viral infections, impropriotiferative conditions, architis, inflammation and autoimmune diseases. Inflammation and autoimmune diseases. Inflammation and autoimmune diseases. Inflammation and appropriate in a cell or population of cell. The nucleic acid sequence and the BID protein can be used for treating immunodeficiency disease (including AIDS), senescence, neurodegenerative disease, isoheamic and reperfusion cell death, infertility and wound-healing. Primers derived from the nucleic acid encoding the BID protein can be used for detecting dynamtitating the protein and for detecting alterations in the nucleic acid encoding the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human: BH3 interacting domain death agonist: BID: BCL-7 family; apoptosis: regulation; cell death; inflammation; concer: arthritis; autolumnume disease; viral infection; lymphoproliferative.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Disclosure; Page 24; 118pp; English.

The protectin, the NA encoding it or antisense sequences can be used for preventing or treating a decreased apoptotic state that is treated results from a disease such as cancer, viral infections, lymphoproliferative conditions, arthritis, inflammation and autoimmune diseases. Antibodies against the BID protein can be used for cetecting a BID polypeptide in a cell or population of cell. The nucleic acid sequence and the HID protein can be used for treating immunodeficiancy disease (including AIDS), sensequence, neurodegenerative disease, isoheemic and reperfusion cell deach, infertility and cound-healing. Primers derived from the nucleic acid encoding the BID protein can be used for detecting anticating the protein and for detecting alterations in the nucleic acid encoding the BID protein and a for detecting alterations in the nucleic acid encoding the BID protein.
                                                                                                   Mouse: BH3 interacting domain death agonist; BID: BCL-2 family; apoptosis: regulation; call death; inflammation; cancer: arthritis; autoimmune disease; viral infection; lymphoproliferative.

Antibodies against the BID protein can be used for eliciting a BID polypeptide in a cell or population of cell. The encelsic educations, architecting a BID polypeptide in a cell or population of cell. The encelsic educations and the BID protein can also be used for treating immunodeficience and the BID protein can also be used for treating would bealth of the state of the BID protein can be used for detecting allows diseases. Including AIDS), sensescence neurodegenerative would bealth of reperfusion cell death, infertility and for would bealth of the state of the BID protein and be used for detecting allows the BID protein and for the state of the BID protein and for the state of the BID protein and BID protein 
                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Example 8; Page 84; 118pp; English.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     BH3 interacting domain death agonist polypeptide - used for treating decreased apoptotic conditions resulting from inflammation etc.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Korsmeyer
